

ABSTRACT

5 A hydraulic shift gear mechanism for a bicycle having a  
positioning mechanism for controlling the motion of the piston  
of a master cylinder assembly is disclosed, wherein the master  
cylinder assembly is in communication with a slave cylinder  
for operation of a derailleur. The positioning mechanism  
preferably includes a pivot shaft spaced apart from the  
handlebar, a rotating member rotatable about the pivot shaft,  
10 a push mechanism for rotating the rotating member in a first  
direction and a return mechanism for rotating the rotating  
member in a second direction. The push mechanism preferably  
includes a first latch segment which engages a corresponding  
push pawl to rotate the rotating member. The return mechanism  
preferably comprises a second latch segment and a return pawl,  
the return pawl having a first claw and a second claw which  
alternately engage the second latch segment. The rotating  
member is preferably operatively engaged with the piston of  
the master cylinder, wherein the rotation of the rotating  
member translates to an axial motion of the piston rod. In a  
more preferred embodiment of the invention, an adjuster piston  
is threadingly engaged with the master cylinder assembly for  
adjusting the initial position of the slave cylinder.
